When an employee, customer, or other individual vomits or has a diarrheal event in a food establishment, there is a real potential for the spread of harmful pathogens in the establishment. Putting the proper response into action in a timely manner can help reduce the likelihood that food may become contaminated and that others may become ill as a result of the accident.

The 2013 FDA Food Code requires that all food establishments have a procedure for responding to vomiting and diarrheal events. This requirement is specified under Regulation 2-501.11 and states:

**A FOOD ESTABLISHMENT shall have procedures for EMPLOYEES to follow when responding to vomiting or diarrheal events that involve the discharge of vomitus or fecal matter onto surfaces in the FOOD ESTABLISHMENT. The procedures shall address the specific actions EMPLOYEES must take to minimize the spread of contamination and the exposure of EMPLOYEES, consumers, FOOD, and surfaces to vomitus or fecal matter.**

**Note:** Effective cleaning of vomitus and fecal matter in a food establishment should be handled differently from routine cleaning procedures.
Vomiting and diarrheal accidents should be cleaned up using the following recommended step:

- Segregate the area. For vomiting accidents, contain all areas within 25 feet of incident.
- Wear disposable gloves, apron, food covers and mask during cleaning. To help prevent the spread of disease, it is recommended that a disposable mask and/or cover gown (or apron) be worn when cleaning liquid matter.
- Wipe up the matter with towels and dispose into a plastic garbage bag.
- Mix up a chlorine bleach solution that is stronger than the chlorine solution used for general cleaning. The CDC recommends 1000-5000 ppm or 1 cup of household bleach [5.25%] per gallon of water. Other Norovirus approved sanitizers can be used on carpeted areas. **Note: quaternary ammonia is not an effective sanitizer for Norovirus.**

![Image showing a bottle with 3/4 cup of concentrated bleach plus 1 gallon of water, with a note about adjusting concentration if regular strength bleach is used.]

- Apply the bleach solution to the area, scrub if necessary, and allow it to remain wet in the affected area for at least 10 minutes. Clean up any remaining solid matter.
- Reapply bleach solution. Allow to air dry. Dispose of any remaining sanitizer solution once the accident has been cleaned up.
- Discard gloves, mask, and cover gown (or apron) in a plastic bag.
- Take measures to dispose of and/or clean and disinfect the tools and equipment used to clean up vomit and fecal matter.
- Discard any food or single service items that may have been exposed.
- Wash hands thoroughly with soap and water.

![Image showing how to wash hands properly: wet hands, apply liquid soap, lather and scrub for 20 sec, rinse for 10 sec, dry hands, turn off tap.]

- Minimize the risk of disease transmission through the prompt removal of ill employees, customers and others from areas of food preparation, service, and storage.
